C;Comment: Band 3 is the major integral glycoprotein of the erythrocyte membrane. A
C;Comment: Band 3 has at least two functional domains. Its integral domain mediates
ing sites for cytoskeletal proteins, glycolytic enzymes, and hemoglobin.

erythrocyte anion exchanger homolog AE3 - mouse
C; Species: Mus musculus (house mouse)
C; Species: Was musculus (house mouse)
C; Date: 02-Feb-1990 #sequence_revision 02-Feb-1990 #text_change 20-Aug-1999
C; Accession: A33638
R; Kopito, R. R.; Lee, B. S.; Simmons, D. M.; Lindsey, A. E.; Morgans, C. W.; Schneider, K. Cell 59, 927-937, 1989
A; Title: Regulation of intracellular pH by a neuronal homolog of the erythrocyte anio A; Reference number: A33638; MUID:90075236; PMID:2686841
A; Reference number: A33638
A; Retaus: preliminary
A; Molecule type: mRNA
A; Rossidues: 1-1227 (KOP)
A; Rossidues: 1-1227 (KOP)
A; Rossidues: 1-1227 (KOP)
C; Superfamily: band 3 anion transport protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1037 GLPWLTAATVRSVTHVNALT 1056

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                ö
                                               The invention relates to an isolated Band 3 polypeptide that comprises any of 4 20 residue amino acid sequences, or their fragments that bind to an MSPP-1 polypeptide or a polypeptide with any of 8 291.131 base pair sequences. The methods and compositions of the present invention are useful for the prevention and treatment of malarial infection. The present invention, develops new and more improved methods based upon inhibiting the particular interactions between the malarial parasite and a cognate molecule present in the host and subsequently minimising therapeutic approaches. The invention is useful in gene therapy. The present invention also provides a vaccine for malaria. The present sequence is human Band 3 peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an isolated Band 3 polypeptide that comprises any of 4 20 residue amino acid sequences, or their fragments that bind to an MSP-1 polypeptide or a polypeptide with any of 8 291-1331 base pair sequences. The methods and compositions of the present invention are useful for the prevention and treatment of malarial infection. The present invention, develops new and more improved methods based upon inhibiting the particular interactions between the malarial parasite and a cognate molecule present in the host and subsequently minimising harmful side effects and drug resistance that may be due to non-specific therapeutic approaches. The invention is useful in gene therapy. The present invention also provides a vaccine for malaria. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; Band 3 polypeptide; malarial infection; drug resistance; vaccine; protozoacide; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated Band 3 polypeptide which selectively binds to merozite surface protein-1, useful for the prevention and treatment of malarial

The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (I) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis, hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is associated with coronary heart disease. The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart (see ABA1305). The present sequence is a protein encoded by one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease, hypertension, cardiac arrhythmias and congenital heart disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human brain expressed single exon probe encoded protein SEQ ID NO: 31897.
            Protein #6029 encoded by probe for measuring heart cell gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                            Single exon nucleic acid probes for analyzing gene expression in human hearts -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; brain expressed exon; gene expression analysis; probe;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                  foetal liver; gene expression; single exon nucleic acid probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human fetal liver
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;

probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to single exon nucleic acid probes (SENP: see AAI31315-AAI57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for
                                                                                                                                                                                                   present invention provides a number of single exon nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human placenta -

                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple scierosis, schizophrein, epilepsy and cancers. The present sequence is a protein encoded by one of

Also included are a microarray comprising the novel set of probes which hybridise at high stringency to a nucleic acid expressed in the human lung; measuring gene expression in a sample derived from human lung, comprising (a) contacting the array with a collection of detectably labeled nucleic acids derived from human lung mRNA, and (b) measuring the label detectably bound to each probe of
predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                  Human peptide encoded by genome-derived single exon probe SEQ ID 31860.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Hermansky-Pudlak syndrome; sarcoidosis; pulmonary haemosiderosis; pulmonary histiocytosis; lymphangioleiomyomtosis; Karagener syndrome; pulmonary alveolar proteinosis; fibrocystic pulmonary dysplasia; primary ciliary dyskinesis; pulmonary hypertension;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Spatially-addressable set of single exon nucleic acid probes, used to measure gene expression in human lung samples -

C the eukaryote; and (b) detecting specific phonicisation of detectably labeled nucleic acids from eukaryote lung markh, to a single exon probe, labeled nucleic acids from eukaryote lung markh, to a single exon probe, labeled nucleic acids from eukaryote lung markh, to a single exon probe, labeled nucleic acids from eukaryote lung markh, to a single exon probe, omprising (a) identifying exons from genomic sequence by the method comprising (a) identifying exons from genomic sequence by the method tissues and/or cell types using hybridisation to a single exon accordance by the method accordance and (b) measuring the expression of each of the exons in several tissues and/or cell types using hybridisation to a single exon accordance by the expression of the exons should be assigned to a single gene; a peptide comprising one of a specification, or encoded by the probes/open reading frames (ORF). The probes are used for gene probes/open reading frames (ORF). The probes are used for gene probes/open reading frames (ORF). The probes are used for gene cuch as asthma, lung cancer, chronic obstructive pulmonary diseases (COPD), interstitial lung disease (ILD), familial idiopathic pulmonary hearmansty-pullak syndrome, sarcoidosis, pulmonary hearmansty-pullak syndrome, sarcoidosis, pulmonary hyeolar proteinosis, Raragener syndrome, sarcoidosis, pulmonary hyeolar proteinosis, Raragener syndrome, sarcoidosis, pulmonary hyeolar proteinosis, Raragener syndrome, sarcoidosis, and hyaline membrane disease. The present sequence is a peptide/protein where the servence data for this total or the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Synthetic senescent cell antigen and peptide(s) - used to detect antibodies to SCA, study cellular ageing and auto-immune
